Contents:

At this exhibition, we are going to display the following products.

Membrane Support Substrates

- The water business market is expanding against the background of economic growth and population growth in emerging countries and replacement demand in developed countries. Water treatment membrane are a general term for separation membranes that separate and remove impurities contained in water, and are used in seawater desalination, water purification, etc.
- Our 100% polyester wet-laid nonwoven fabric is used as the “Membrane Support Substrates” to compensate for the strength that is lacking in the separation membrane alone.
- As a special product, we also have a lineup of wet-laid nonwoven fabrics made of 100% polyolefin fibers that have excellent resistance to acids and alkalis and have heat-sealing properties.

Liquid filter Media

- Liquid filter Media has high filtration accuracy and long-life filtration. Our Liquid filter media are widely used in EDM* filter media.
 - * Electrical Discharge Machining
